

SAS SQL Assignment 3

Assignment 3

1. I want you to **create a table** out of the statesstats dataset, and give it the name **finalstats**. I also want you to use Case expression to come up with a rating system based on the **Unemployment column**. (ie If some state has a particular unemployment rate, they would get a specific numeric rating) You can come up with any rating system, as long as it's based on the **Unemp column**. Name the column **UnemploymentR**.

2. Next, I want you to **add a new column**. I want you to call it **OverallCrimeRisk**. A label and format would be nice as well.

3. Finally, I want you to update that Column by adding rows. I want the OverallCrimeRisk column to be based on the $\text{UnemploymentR} * \text{crime}/100$

Good luck,

Ermin
