Kolmorgov-Smirnov (Article)

SAS Code to run Kolmogorov–Smirnov Test

KS refers to the distance between distributions of positive outcome and negative outcome. Higher KS means more separation of positive vs negative.

```
proc npar1way data=validacc edf; /*edf is the option to run K-S test*/

class Lo_Status; /* dependent variable*/

var p_1; /* p_1 are the predicted probabilities of the validacc dataset. You can
go inside your dataset, in this case validacc and check what that column is
called*/

run;
```
